EPA Allows Highly Toxic Weedkiller on Food Crops — But Not Golf Courses

Concerns about the safety of paraquat, a highly toxic herbicide, pushed the EPA in 2021 to ban its use on golf courses — but the EPA still allows the weedkiller to be sprayed on almonds, walnuts, alfalfa and other crops.

Concerns about the safety of paraquat, a highly toxic herbicide, pushed the U.S. Environmental Protection Agency (EPA) in 2021 to ban its use on golf courses — but the weedkiller is still permitted for agricultural use, and a new first-of-its-kind analysis shows how the EPA's continued approval of the substance has put low-income Latino communities at disproportionate risk for health impacts.

The Environmental Working Group (EWG) found in the study released on March 27 that 5.3 million pounds of paraquat were sprayed over a five-year period in California, the only state with enough data to analyze for the analysis.

Most of the weedkiller's use was concentrated in central counties where farms produce almonds, walnuts, alfalfa and other crops — and where Latinos people make up about 75% of the population and are overwhelmingly low-income.

Ninety-six percent of farmworkers in the state are Latino, and 90% of people in the agricultural workforce were born outside of the U.S., making immigrants who often work for low wages among the people who are most affected by continued use of paraquat on farms.

The ingestion of a single teaspoon of paraquat is considered deadly, which has led 60 countries to ban the chemical while the EPA has continued to allow its use. The analysis published in January concluding that its health risks were outweighed by the economic benefits of using paraquat.

Al Rabine, an analyst for EWG who authored the report, said the EPA has also ignored a "mountain of evidence" that paraquat causes Parkinson's disease.

An epidemiological study of central California found that people living within a third of a mile of where paraquat is sprayed are twice as likely to develop Parkinson's.

"Paraquat is not only a threat to our environment but also a direct danger to the health and well-being of these communities, particularly Latino populations, who make up the majority of the population," said Rabine.

Rabine continued:

> "The findings of our analysis underscore the urgent need for action by the state to protect these communities from the harmful effects of exposure to this toxic weedkiller."

Between 2017-2021, EWG found, about 80% of the paraquat used on California crops was sprayed within Latino-majority census tracts. The group identified Kern County and the towns of Shafter and Wasco as "hot spots" of paraquat use.

"These three communities combined have over 80% Latino residents who witnessed almost 180,000 pounds of paraquat spraying during that time period," the group said.

In Kern County, which has a poverty rate of nearly 30%, EWG found that 1.2 million pounds of the herbicide were sprayed over roughly 1,200 square miles of farmland — threatening not only farmworkers who completed the work but also farmworkers who live in the surrounding communities, as paraquat can remain in soil and travel through the air — as well as coming home with workers on their clothing and potentially exposing their families.

RFK Jr. and Brian Hooker's *New* Book: "Vax-Unvax"

EWG identified five "fatal flaws" in the analysis the EPA has used to defend its continued approval of paraquat for farming, including:

- Ignoring new evidence about the potential health impacts of paraquat that has come out of legal action against its manufacturer, the Switzerland-based and Chinese-owned Syngenta.
- Ignoring the fact that paraquat use is largely concentrated in specific communities and centered largely by low-income Latino farmworkers.
- Excluding from its safety analysis paraquat applications can drift through the air, especially on windy days.
- Failing to consider the health and environmental costs to farm owners, workers and people who live near farmland.
- Dismissing a growing body of research linking paraquat to Parkinson's, including 90 articles of evidence and "cutting edge studies" submitted by the Michael J. Fox Foundation for Parkinson's Research.

EWG called on the EPA to follow the lead of dozens of countries that have banned paraquat — but warned that states must not wait for the federal government to take action.

"Federal pesticide law sets a floor, not a ceiling — states can choose to restrict a chemical, even without an EPA ban," wrote EWG government affairs manager Geoff Horsfield and toxicologist Alexis Temkin.

"To protect their residents and public health, state and local governments should exercise their power to ban paraquat."

Immigrant communities across central California, Horsfield said, "should not be subjected to additional health risks due to the negligent actions of pesticide manufacturers, farm owners, and state regulatory agencies."

My gosh, this herbicide never goes away. I remember in the 70's, pot smokers worried about their weed being contaminated with Paraquat and I thought they banned it but it was only categorized as a restricted use weed control which basically means that it's not an over the counter weed control and that certified applicators can purchase it and use it as they see fit without enforcement.
I'm not convinced that the immigrant communities are the most vulnerable. There isn't any concern for native born American citizens much less, immigrants.
The EPA is a corrupt agency. They are the ones who grandfathered that include a course. No wonder these chemicals are not allowed on courses.

Why would they need to put it on a golf course though. Regardless, health is for the wealthy at this point. The wealthy can afford organic, organic, organic. The poor are stuck with simple carbs and foods that are coated with chemicals.

Yep, the rich get the best but they are also getting poisoned and don't care. What matters to them is that the course is beautiful, green and clean. Golf course maintenance is HIGH maintenance because they must be kept pristine. No gardinals are allowed to land on their precious turf. They use herbicides on a golf course to control the weeds and brush! Golf courses are not natural. Why do you think they are so costly to play a round? I've had friends who worked on these golf courses and they tell pick every little detail all day long, seven days a week. The crocuses are spotless, the cups are changed and always clean, the turf is perfectly green from tons of nitrogen, etc... Extra low courses being built because the rich people who play golf can't be bothered to walk the extra steps to the ten-hole wealthy. What really pisses me off is that golf courses really destroy the environment and poison everything and EU forbid geese or other animals get on the course, they get poisoned with blue dye. I was last year that a course that was being constructed in CA and environmentalists managed to get delayed and people's dogs were getting poisoned by something in it.
There is a course in my area located on a naval weapons station and the course was built over tons of deadly toxins. Many of the employees have gotten cancers from working there but environmentalists were trying to block more dangerous to clean up the toxins than to let them leach into the soil over the next two hundred years. Here's a good article

Golf courses are heavily sprayed with herbicides. How do you think they maintain the monocrop grass without weeds? Stay away from golf courses too.

Then likely it gets into our food as well! I use a lot of almond milk and now am worried. Following please! Is it still being used or in the past only? I didn't see a timeline.

I was a commercial onion grower and have used paraquat in the past and had concerns about its toxicity forty years ago. It is mainly a defoliant, which means it dries the foliage of plants. I asked the cooperative extension agent about residues on the onion crop when I heard that some farmers were using it to dry the onion tops. He said that was a misunderstood science; he explained to me that paraquat broke down extremely quickly.
This extension agent was one of the best of the best and traveled around the US and Canada advising on informational issues related to help the farming industry. He informed me that after two days they could find no trace of paraquat on anything it was sprayed on. He also informed me that it was extremely toxic when fresh.

Do I really have to believe this.
Paraquat was banned in the EU in 2007 due to 500 Poisoms. Of course the chemical industry says, it does NOT harm ???? how come poisonins die from a ????
The scavenger birds (harrier and falcon etc) have a big problem of infertility. how come?? if it is not harmful.

I'm not sure what they are doing to poison the Dingos in Australia. Other animals will die as a result. Sickening.

Read Silent Spring by Rachel Carson. G-d bless that woman. When I was in college I spent a year researching Dioxins because they had almost been wiped out by DDT. Poisons like DDT and Paraquat are not only harmful to the animals that eat them or their behavior because most animals know when they are not healthy enough to rear their young and will destroy them or in the case of the Osprey, the chicks will destroy each other which is what I researched. Fortunately, at the time I was researching, DDT was banned in the US but it is still being used in the EU today. The chemical companies wanted to blame the decline on the lack of Menhaden fish due to over fishing which is their main food staple and there was a huge debate about that. Depending on which industry one works for will determine their opinion about anything environmental which is why I don't trust any of the authorities.
I'm very concerned our industry will return to using DDT due to the fear mongering of mosquito born illnesses with the added benefit of depopulating humans and wildlife and domestic pets.

They also say the same thing about glyphosate. In fact, it was my local extension agent that told me that Roundup was 'organic' and was safe enough to drink. Monsanto used that very line in their marketing. I have never trusted an extension agent to advise me on any chemicals because they are always in the pocket of the chemical companies. I do, however, use their services for soil testing and other horticulture issues.

Key words: "to help the farming industry". So he is biased for farmers, who want to use paraquat.

Paraquat is only one of many herbicides. I wrote an Op-ed on Herbicides a few weeks ago (https://www.mainenews.c... ...and there are many natural actions from which to choose. Adding on Pesticides, Fungicides, etc. only exacerbates the problem.

Never seen either when you were spaying that on cannabis fields back in the 70s, mainly in Mexico. When the public found out, all hell was raised, and they had to quit. I see they are back at it today.

Um I had an ex marine living at my house in the 90s whose job it was to fly down to Mexico and service the planes the govt was using to spray drug fields. He said the cartels raided them several times and it was dangerous duty.
